1.0. Introduction

The ACR39 PC-linked Smart Card Reader acts as an interface for the communication between a computer and a smart card. Different types of smart cards have different commands and different communication protocols, which, in most cases, prevent direct communication between a smart card and a computer. The ACR39 Smart Card Reader establishes a uniform interface from the computer to the smart card for a wide variety of cards. By taking care of the card's particulars, it releases the computer software programmer from being responsible with smart card operations' technical details, which in many cases, are not relevant to the implementation of a smart card system.

1.1. Reference Documents

The following related documents are available from www.usb.org

- Universal Serial Bus Specification 2.0 (also referred to as the USB specification), April 27, 2000
- Universal Serial Bus Common Class Specification 1.0, December 16, 1997
- Universal Serial Bus Device Class: Smart Card CCID Specification for Integrated Circuit(s) Cards Interface Devices, Revision 1.1, April 22, 2005

The following related documents can be ordered through www.ansi.org

- ISO/IEC 7816-1; Identification Cards Integrated circuit(s) cards with contacts Part 1: Physical Characteristics
- ISO/IEC 7816-2; Identification Cards Integrated circuit(s) cards with contacts Part 2: Dimensions and Locations of the contacts
- ISO/IEC 7816-3; Identification Cards Integrated circuit(s) cards with contacts Part 3: Electronic signals and transmission protocols

2.0. Features

2.1. ACR39U

- USB Full Speed Interface*
- Plug-and-Play CCID support brings utmost mobility
- Smart Card Reader:
 - Contact Interface:
 - Supports ISO 7816 Class A, B and C (5 V, 3 V, 1.8 V) cards
 - Supports CAC (Common Access Card)
 - Supports SIPRNET Card
 - Supports J-LIS Card
 - Supports microprocessor cards with T=0 and T=1 protocol
 - Supports memory cards
 - Supports PPS (Protocol and Parameters Selection)
 - Features Short Circuit Protection
- Application Programming Interface:
 - Supports PC/SC
 - Supports CT-API (through wrapper on top of PC/SC)
- Supports Android[™] 3.1 and later²
- Compliant with the following standards:
 - o EN60950/IEC 60950
 - o ISO 7816
 - EMV[™] Level 1 (Contact)
 - o PC/SC
 - o CCID
 - o CE
 - o FCC
 - o WEEE
 - o RoHS
 - o REACH
 - \circ TAA (USA)
 - o J-LIS (Japan)
 - o VCCI (Japan)
 - o PBOC (China)
 - Microsoft® WHQL

2.2. ACR39U PocketMate II

- USB Full Speed Interface*
- Plug-and-Play CCID support brings utmost mobility
- Swivel Motion Design
- Smart Card Reader:
 - Contact Interface:
 - Supports ISO 7816 Class A, B and C (5 V, 3 V, 1.8 V) cards
 - Supports CAC (Common Access Card)
 - Supports SIPRNET Card
 - Supports J-LIS Card
 - Supports microprocessor cards with T=0 and T=1 protocol
 - Supports memory cards
 - Supports PPS (Protocol and Parameters Selection)
 - Features Short Circuit Protection
- Application Programming Interface:
 - Supports PC/SC
 - Supports CT-API (through wrapper on top of PC/SC)
- Supports Android[™] 3.1 and later³
- Compliant with the following standards:
 - o EN60950/IEC 60950
 - o ISO 7816
 - EMV[™] Level 1 (Contact)
 - o PC/SC
 - o CCID
 - **CE**

³ Uses an ACS Defined Android Library

^{*}Available in USB Type A, USB Micro-B, and USB Type C Connectors

2.3. ACR39T

- USB Full Speed Interface*
- Plug-and-Play CCID support brings utmost mobility
- Includes protective USB cap
- Smart Card Reader:
 - Contact Interface:
 - Supports ISO 7816 Class A, B and C (5 V, 3 V, 1.8 V) cards
 - Supports microprocessor cards with T=0 and T=1 protocol
 - Supports memory cards
 - Supports PPS (Protocol and Parameters Selection)
 - Features Short Circuit Protection
- Application Programming Interface:
 - Supports PC/SC
 - Supports CT-API (through wrapper on top of PC/SC)
- Supports Android[™] 3.1 and later⁴
- Compliant with the following standards:
 - o EN60950/IEC 60950
 - o ISO 7816
 - o PC/SC
 - o CCID
 - o CE
 - o FCC
 - o WEEE
 - o RoHS
 - o REACH
 - o VCCI (Japan)
 - Microsoft® WHQL

⁴ Uses an ACS Defined Android Library

^{*}Available in USB Micro-B and USB Type C Connectors

2.4. ACR39F

- USB 2.0 Full Speed Interface (via detachable cable)
- Plug and Play CCID support brings utmost mobility
- Smart Card Reader:
 - Contact Interface:
 - Supports ISO 7816 Class A, B and C (5 V, 3 V, 1.8 V) cards
 - Supports CAC (Common Access Card)
 - Supports SIPRNET Card
 - Supports J-LIS Card
 - Supports microprocessor cards with T=0 or T=1 protocol
 - Supports memory cards
 - Supports PPS (Protocol and Parameters Selection)
 - Features Short Circuit Protection
- Application Programming Interface:
 - Supports PC/SC
 - Supports CT-API (through wrapper on top of PC/SC)
- Supports Android[™] 3.1 and later⁵
- Compliant with the following standards:
 - o EN 60950/IEC 60950
 - o ISO 7816
 - EMV[™] Level 1 (Contact)
 - o PC/SC
 - o CCID
 - o CE
 - o FCC
 - \circ WEEE
 - o RoHS
 - o REACH
 - Microsoft® WHQL

⁵ PC/SC and CCID support are not applicable

3.0. Smart Card Support

3.1. MCU Cards

The ACR39 is a PC/SC–compliant smart card reader that supports ISO 7816 Class A, B and C (5 V, 3 V, and 1.8 V) smart cards. It supports up to 600Kbps smart card read/write speed It also works with MCU cards following either the T=0 or T=1 protocol.

The card ATR indicates the specific operation mode (TA2 present; bit 5 of TA2 must be 0). When that particular mode is not supported by the ACR39, it will reset the card to negotiable mode. If the card cannot be set to negotiable mode, the reader will then reject the card.

When the card ATR indicates the negotiable mode (TA2 not present) and communication parameters other than the default parameters, the ACR39 will execute the PPS and try to use the communication parameters that the card suggested in its ATR. If the card does not accept the PPS, the reader will use the default parameters (F=372, D=1).

Note: For the meaning of the aforementioned parameters, please refer to ISO 7816-3.

3.2. Memory-based Smart Cards

ACR39 works with several memory-based smart cards such as:

- Cards following the I2C bus protocol (free memory cards) with maximum 128 bytes page with capability, including:
 - o Atmel®: AT24C01/02/04/08/16/32/64/128/256/512/1024
 - o SGS-Thomson: ST14C02C, ST14C04C
 - Gemplus: GFM1K, GFM2K, GFM4K, GFM8K
- Cards with intelligent 1 KB EEPROM with write-protect function, including:
 - o Infineon®: SLE4418, SLE4428, SLE5518 and SLE5528
- Cards with intelligent 256-byte EEPROM with write-protect function, including:
 - o Infineon®: SLE4432, SLE4442, SLE5532 and SLE5542

Page 10 of 40

4.0. USB Interface

4.1. Communication Parameters

The ACR39 is connected to a computer through USB as specified in the USB Specification 2.0. The ACR39 works in full speed mode, i.e. 12 Mbps.

Pin	Signal	Function
1	V _{BUS}	+5 V power supply for the reader
2	D-	Differential signal transmits data between ACR39 and computer
3	D+	Differential signal transmits data between ACR39 and computer
4	GND	Reference voltage level for power supply

Table 2: USB Interface Wiring

4.2. Endpoints

The ACR39 uses the following endpoints to communicate with the host computer:

Control Endpoint	For setup and control purposes.
Bulk-OUT	For command to be sent from host to ACR39.
	(Data packet size is 64 bytes)
Bulk-IN	For response to be sent from ACR39 to host.
	(Data packet size is 64 bytes)
Interrupt-IN	For card status message to be sent from ACR39 to host.
	(Data packet size is 8 bytes)

Page 11 of 40

5.0. Contact Smart Card Interface

The interface between the ACR39 and the inserted smart card follows the specification of ISO 7816-3, with certain restrictions or enhancements to increase the practical functionality of the ACR39.

5.1. Smart Card Power Supply VCC (C1)

The current consumption of the inserted card must not be higher than 50 mA.

5.2. Programming Voltage VPP (C6)

According to ISO 7816-3, the smart card contact C6 (VPP) supplies the programming voltage to the smart card. Since all common smart cards in the market are EEPROM-based and do not require the provision of an external programming voltage, the contact C6 (VPP) has been implemented as a normal control signal in the ACR39. The electrical specifications of this contact are identical to those of the signal RST (at contact C2).

5.3. Card Type Selection

The controlling computer must always select the card type through the proper command sent to the ACR39 prior to activating the inserted card. This includes both memory cards and MCU-based cards.

For MCU-based cards, the reader allows for the selection of the preferred protocol, T=0 or T=1. However, this selection is accepted and carried out by the reader through the PPS only if the card inserted in the reader supports both protocol types. If an MCU-based card supports only one protocol type, T=0 or T=1, the reader automatically uses that protocol type, regardless of the protocol type selected by the application.

5.4. Interface for Microcontroller-based Cards

For microcontroller-based smart cards, only the contacts C1 (VCC), C2 (RST), C3 (CLK), C5 (GND) and C7 (I/O) are used. A frequency of 4.8 MHz is applied to the CLK signal (C3).

5.5. Card Tearing Protection

The ACR39 provides a mechanism to protect the inserted card when it is suddenly withdrawn while it is powered up. The power supply to the card and the signal lines between the ACR39 and the card are immediately deactivated when the card is removed.

Note: The ACR39 never switches on the power supply to the inserted card by itself. The controlling computer through the proper command sent to the reader must explicitly do this.

Page 12 of 40

6.0. Power Supply

The ACR39 requires a voltage of 5 V DC, 100 mA, regulated, power supply. The ACR39 gets its power from the computer (through the cable supplied along with each type of reader).

6.1. Status LED

The LED indicates the activation status of the smart card interface:

• Flashing slowly (turns on 200 ms every 2 seconds)

Indicates the ACR39 is powered up and in the standby state. Either a smart card has not been inserted or the inserted smart card has not been powered up.

• Lighting up

Indicates power supply to the smart card is switched on, i.e., the smart card is activated.

• Flashing quickly

Indicates there are communications between the ACR39 and the smart card.

Page 13 of 40

7.0. USB Communication Protocol

The ACR39 shall interface with the host through USB connection. A specification, namely CCID, has been released within the industry defining such a protocol for USB chip-card interface devices. CCID covers all the protocols required for operating smart cards.

The configurations and usage of USB endpoints on ACR39 shall follow CCID Rev 1.0 Section 3.

An overview is summarized below:

- 1. *Control Commands* are sent on the control pipe (default pipe). These include class-specific requests and USB standard requests. Commands that are sent on the default pipe report information back to the host on the default pipe.
- 2. CCID Events are sent on the interrupt pipe.
- 3. *CCID Commands* are sent on the BULK-OUT endpoint. Each command sent to the ACR39 has an associated ending response. Some commands can also have intermediate responses.
- 4. *CCID Responses* are sent on the BULK-IN endpoint. All commands sent to the ACR39 must be sent synchronously (e.g., *bMaxCCIDBusySlots* is equal to 01h for ACR39).

Offset	Field	Size	Value	Description
0	bLength	1		Size of this descriptor, in bytes.
1	bDescriptorType	1		CCID Functional Descriptor type.
2	bcdCCID	2		CCID Specification Release Number in binary-coded decimal.
4	bMaxSlotIndex	1		One slot is available on ACR39.
5	bVoltageSupport	1		ACR39 can supply 1.8 V, 3 V, and 5 V to its slot.
6	dwProtocols	4		ACR39 supports T=0 and T=1 protocol.
10	dwDefaultClock	4		Default ICC clock frequency is 4.8 MHz.
14	dwMaximumClock	4		Maximum supported ICC clock frequency is 4.8 MHz.
18	bNumClockSupported	1		Does not support manual setting of clock frequency.
19	dwDataRate	4		Default ICC I/O data rate is 12918 bps.
23	dwMaxDataRate	4		Maximum supported ICC I/O data rate is 826 Kbps.
27	bNumDataRatesSupported	1		Does not support manual setting of data rates.
28	dwMaxIFSD	4		Maximum IFSD supported by ACR39 for protocol T=1 is 247.
32	dwSynchProtocols	4		ACR39 does not support synchronous card.
36	dwMechanical	4		ACR39 does not support special mechanical characteristics.

The ACR39 supported CCID features are indicated in its Class Descriptor:

Advanced Card Systems Ltd. Card & Reader Technologies

Offset	Field	Size	Value	Description
40	dwFeatures	4		 ACR39 supports the following features: Automatic ICC clock frequency change according to parameters Automatic baud rate change according to frequency and FI, DI parameters TPDU level change with ACR39
44	dwMaxCCIDMessageLength	4		Maximum message length accepted by ACR39 is 271 bytes.
48	bClassGetResponse	1		Insignificant for TPDU level exchanges.
49	bClassEnvelope	1		Insignificant for TPDU level exchanges.
50	wLCDLayout	2		No LCD.
52	bPINSupport	1		With PIN Verification.
53	bMaxCCIDBusySlots	1		Only 1 slot can be simultaneously busy.

Page 15 of 40

7.1. CCID Bulk-OUT Messages

The ACR39 shall follow the CCID Bulk-OUT Messages as specified in CCID Rev 1.0 Section 4.1. In addition, this specification defines some extended commands for operating additional features.

This section lists the CCID Bulk-OUT Messages to be supported by the ACR39.

7.1.1. PC_to_RDR_lccPowerOn

This command activates the card slot and returns the ATR from the card.

Offset	Field	Size	Value	Description
0	bMessageType	1	62h	
1	dwLength	4	00000000h	Size of extra bytes of this message.
2	bSlot	1		Identifies the slot number for this command.
5	bSeq	1		Sequence number for command.
6	bPowerSelect	1		Voltage that is applied to the ICC: 00h – Automatic Voltage Selection 01h – 5 V 02h – 3 V 03h – 1.8V Note : Automatic Voltage selection sequence is 1.8V, then 3V and then 5V.
7	abRFU	2		Reserved for future use.

The response to this message is the *RDR_to_PC_DataBlock* message and the data returned is the Answer-to-Reset (ATR) data.

7.1.2. PC_to_RDR_lccPowerOff

This command deactivates the card slot.

Offset	Field	Size	Value	Description
0	bMessageType	1	63h	
1	dwLength	4	00000000h	Size of extra bytes of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	abRFU	3		Reserved for future use.

The response to this message is the *RDR_to_PC_SlotStatus* message.

7.1.3. PC_to_RDR_GetSlotStatus

This command gets the current status of the slot.

Offset	Field	Size	Value	Description
0	bMessageType	1	65h	
1	dwLength	4	00000000h	Size of extra bytes of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	abRFU	3		Reserved for future use.

Page 16 of 40

The response to this message is the *RDR_to_PC_SlotStatus* message.

7.1.4. PC_to_RDR_XfrBlock

This command transfers data block to the ICC.

Offset	Field	Size	Value	Description
0	bMessageType	1	6Fh	
1	dwLength	4		Size of abData field of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	bBWI	1		Used to extend the CCIDs Block Waiting Timeout for this current transfer. The CCID will timeout the block after "this number multiplied by the Block Waiting Time" has expired.
8	wLevelParameter	2	0000h	RFU (TPDU exchange level).
10	abData	Byte array		Data block sent to the CCID. Data is sent "as is" to the ICC (TPDU exchange level).

The response to this message is the *RDR_to_PC_DataBlock* message.

7.1.5. PC_to_RDR_GetParameters

This command gets the slot parameters.

Offset	Field	Size	Value	Description
0	bMessageType	1	6Ch	
1	dwLength	4	00000000h	Size of extra bytes of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	abRFU	3		Reserved for future use.

The response to this message is the *RDR_to_PC_Parameters* message.

7.1.6. PC_to_RDR_ResetParameters

This command resets the slot parameter to default value.

Offset	Field	Size	Value	Description
0	bMessageType	1	6Dh	
1	dwLength	4	00000000h	Size of extra bytes of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	abRFU	3		Reserved for future use.

The response to this message is the *RDR_to_PC_Parameters* message.

7.1.7. PC_to_RDR_SetParameters

This command sets the slot parameters.

Offset	Field	Size	Value Description	
0	bMessageType	1	61h	
1	dwLength	4		Size of extra bytes of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	bProtocolNum	1		Specifies what protocol data structure follows: 00h – Structure for protocol T=0 01h – Structure for protocol T=1 The following values are reserved for future use: 80h – Structure for 2-wire protocol
				81h – Structure for 3-wire protocol 82h – Structure for I2C protocol
8	abRFU	2		Reserved for future use.
10	abProtocolDataStructure	Byte array	Protocol Data Structure.	

Protocol Data Structure for Protocol T=0 (*dwLength*=0000005h)

Offset	Field	Size	Value	Description
10	bmFindexDindex	1		B7-4 – FI – Index into the table 7 in ISO/IEC 7816-3:1997 selecting a clock rate conversion factor.
10	bini index bindex	I		B3-0 – DI – Index into the table 8 in ISO/IEC 7816-3:1997 selecting a baud rate conversion factor.
				B0 – 0b, B7-2 – 000000b
11	bmTCCKST0	1		B1 – Convention used (b1=0 for direct, b1=1 for inverse)
				Note: The CCID ignores this bit.
12	bGuardTimeT0	1		Extra guard time between two characters. Add 0 to 254 etu to the normal guard time of 12 etu. FFh is the same as 00h.
13	bWaitingIntegerT0	1		WI for T=0 used to define WWT.

Offset	Field	Size	Value	Description
14	bClockStop	1		ICC Clock Stop Support: 00h – Stopping the Clock is not allowed 01h – Stop with Clock signal Low 02h – Stop with Clock signal High 03h – Stop with Clock signal either High or Low

Protocol Data Structure for Protocol T=1 (*dwLength*=0000007h)

Offset	Field	Size	Value	Description
10	bmFindexDindex	1		B7-4 – FI – Index into the Table 7 in ISO/IEC 7816-3:1997 selecting a clock rate conversion factor.
		I		B3-0 – DI – Index into the Table 8 in ISO/IEC 7816-3:1997 selecting a baud rate conversion factor.
				B7-2 – 000100b
11	bmTCCKST1	1		B0 – Checksum type (b0=0 for LRC, b0=1 for CRC)
	DITTCCKSTT	I		B1 – Convention used (b1=0 for direct, b1=1 for inverse)
				Note: The CCID ignores this bit.
12	bGuardTimeT1	1		Extra guard time (0 to 254 etu between two characters). If value is FFh, then the guard time is reduced by 1 etu.
13	bMoitingIntogorT1	4		B7-4 – BWI values 0-9h valid
13	bWaitingIntegerT1	1		B3-0 – CWI values 0-Fh valid
				ICC Clock Stop Support:
				00h – Stopping the Clock is not allowed
14	bClockStop	1		01h – Stop with Clock signal Low
				02h – Stop with Clock signal High
				03h – Stop with Clock signal either High or Low
15	bIFSC	1		Size of negotiated IFSC.
16	bNadValue	1	00h	Only support NAD=00h.

The response to this message is the *RDR_to_PC_Parameters* message.

7.2. CCID Bulk-IN Messages

The Bulk-IN Messages are used in response to the Bulk-OUT Messages. The ACR39 shall follow the CCID Bulk-IN Messages as specified in CCID Rev 1.0 Section 4.

This section lists the CCID Bulk-IN Messages to be supported by the ACR39.

7.2.1. RDR_to_PC_DataBlock

This message is sent by the ACR39 in response to the *PC_to_RDR_lccPowerOn*, and *PC_to_RDR_XfrBlock* messages.

Offset	Field	Size	Value	Description
0	bMessageType	1	80h	Indicates that a data block is being sent from the CCID.
1	dwLength	4		Size of extra bytes of this message.
5	bSlot	1		Same value as in Bulk-OUT message.
6	bSeq	1		Same value as in Bulk-OUT message.
7	bStatus	1		Slot status register as defined in CCID Rev 1.0 Section 4.2.1.
8	bError	1		Slot status register as defined in CCID Rev 1.0 Section 4.2.1.
9	bChainParameter	1	00h	RFU (TPDU exchange level).
10	abData	Byte array		This field contains the data returned by the CCID.

7.2.2. RDR_to_PC_SlotStatus

This message is sent by the ACR39 in response to *PC_to_RDR_lccPowerOff*, and *PC_to_RDR_GetSlotStatus* messages.

Offset	Field	Size	Value	Description
0	bMessageType	1	81h	
1	dwLength	4	00 00 00 00h Size of extra bytes of this message.	
5	bSlot	1		Same value as in Bulk-OUT message.
6	bSeq	1	Same value as in Bulk-OUT message.	
7	bStatus	1		Slot status register as defined in CCID Rev 1.0 Section 4.2.1.
8	bError	1		Slot status register as defined in CCID Rev 1.0 Section 4.2.1.
9	bClockStatus	1	Value: 00h – Clock running 01h – Clock stopped in state L 02h – Clock stopped in state H 03h – Clock stopped in an unknown state All other values are RFU.	

Page 20 of 40

7.2.3. RDR_toPC_Parameters

This message is sent by the ACR39 in response to *PC_to_RDR_GetParameters*, *PC_to_RDR_ResetParameters*, and *PC_to_RDR_SetParameters* messages.

Offset	Field	Size	Value	Description
0	bMessageType	1	82h	
1	dwLength	4		Size of extra bytes of this message.
5	bSlot	1		Same value as in Bulk-OUT message.
6	bSeq	1		Same value as in Bulk-OUT message.
7	bStatus	1	Slot status register as defin CCID Rev 1.0 Section 4.2.1	
8	bError	1		Slot error register as defined in CCID Section 4.2.1 and
9	bProtocolNum	1		Specifies what protocol data structure follows: 00h – Structure for protocol T=0 01h – Structure for protocol T=1 The following values are reserved for future use: 80h – Structure for 2-wire protocol 81h – Structure for 3-wire protocol 82h – Structure for 12C protocol
10	abProtocolDataStructure	Byte array		Protocol Data Structure.

Page 21 of 40

8.0. Memory Card Command Set

Memory cards can be accessed via *PC_to_RDR_XfrBlock* command. All functions of memory cards are mapped into pseudo-APDUs.

8.1. Memory Card – 1, 2, 4, 8, and 16 kilobit I2C Card

8.1.1. SELECT_CARD_TYPE

This command is used to power down and up the selected card in the card reader, and then performs a card reset.

Note: This command can be used only after the logical smart card reader communication has been established using SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC Specifications.

Command format (*abData* field in the *PC_to_RDR_XfrBlock*)

Pseudo-APDU							
CLA INS P1 P2 Lc Card Type							
FFh	A4h	00h	00h	01h	01h		

Response data format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error.

8.1.2. SELECT_PAGE_SIZE

This command is used to select the page size to read the smart card. The default value is 8-byte page write. It will reset to the default value whenever the card is removed, or the reader is powered off.

Command format (abdata field in the PC_to_RDR_XfrBlock)

Pseudo-APDU							
CLA INS P1 P2 Lc Page Size							
FFh	01h	00h	00h	01h			

Where:

Page size = 03h for 8-byte page write

- = 04h for 16-byte page write
- = 05h for 32-byte page write
- = 06h for 64-byte page write
- = 07h for 128-byte page write

Page 22 of 40

Response data format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error.

8.1.3. READ_MEMORY_CARD

Command format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU						
	CLA INS	Byte /				
CLA		MSB	LSB	MEM_L		
FFh	B0h					

Where:

Byte Address	Memory address location of the memory card.
MEM_L	Length of data to be read from the memory card.

Response data format (*abData* field in the *RDR_to_PC_DataBlock*)

BYTE 1	 BYTE N	SW1	SW2

Where:

BYTE x Data read from the memory card.

SW1 SW2 = 90 00h if no error.

8.1.4. WRITE_MEMORY_CARD

Command format (*abData* field in the *PC_to_RDR_XfrBlock*)

Pseudo-APDU								
	INIC	Byte Address		Byte Address		BYTE 1		
CLA	INS	MSB	LSB	MEM_L	BYTE N			
FFh	D0h							

Where:

Byte Address	Memory address location of the memory card.
MEM_L	Length of data to be read from the memory card.
ΒΥΤΕ Χ	Data to be written to the memory card.

Page 23 of 40

Response data format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error.

Page 24 of 40

8.2. Memory Card – 32, 64, 128, 256, 512, and 1024 kilobit I2C Card

8.2.1. SELECT_CARD_TYPE

This command is used to power down and up the selected card in the card reader, and then performs a card reset.

Note: This command can be used only after the logical smart card reader communication has been established using SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC Specifications.

Command format (*abData* field in the *PC_to_RDR_XfrBlock*)

Pseudo-APDU							
CLA INS P1 P2					Card Type		
FFh	A4h	00h	00h	01h	02h		

Response data format (*abData* field in the *RDR_to_PC_DataBlock*)

Where:

SW1 SW2 = 90 00h if no error.

8.2.2. SELECT_PAGE_SIZE

This command is used to select the page size to read the smart card. The default value is 8-byte page write. It will reset to the default value whenever the card is removed, or the reader is powered off.

Command format (*abdata* field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU							
CLA INS P1 P2 Lc Page Size								
FFh	01h	00h	00h	01h				

Where:

Data TPDU to be sent to the card.

Page size = 03h for 8-byte page write

- = 04h for 16-byte page write
- = 05h for 32-byte page write
- = 06h for 64-byte page write
- = 07h for 128-byte page write

Page 25 of 40

Response data format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error.

8.2.3. READ_MEMORY_CARD

Command format (abData field in the PC_to_RDR_XfrBlock)

	Р	seudo-	APDU		
CLA	INS	Byte Address			
ULA	INS	MSB	LSB		MEM_L
FFh					
Where:					
INS = B0h for 32, 64, 128					
		= 1011 00	0*b for 10		
			where	e * is the M	
Byte	e Addre	ss	Memory a	ddress loc	
MEN	M_L		Length of	data to be	

Response data format (*abData* field in the *RDR_to_PC_DataBlock*)

BYTE 1	 BYTE N	SW1	SW2

Where:

BYTE x Data read from memory card.

SW1 SW2 = 90 00h if no error.

8.2.4. WRITE_MEMORY_CARD

Command format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU													
CLA	INS	Byte Address	MEM L	BYTE 1		BYTE N								
ULA	ING	MSB	LSB		DITET		DITEN							
FFh														
Where:														
INS			= D0h for	32, 64, 128	8, 256, and	512 ki	lobit iic card							
			= 1101 00	0*b for 102	24 kilobit iic	card								
			where	e * is the M	SB of the 17	7 bit a	ddressing							
Byte	e Addre	SS	Memory a	emory address location of the memory card.										
MEN	M_L		Length of data to be read from the memory card.											

Page 26 of 40

BYTE X Data to be written to the memory card.

Response data format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error.

Page 27 of 40

8.3. Memory Card – SLE4418/SLE4428/SLE5518/SLE5528

8.3.1. SELECT_CARD_TYPE

This command is used to power down and up the selected card in the card reader, and then performs a card reset.

Note: This command can be used only after the logical smart card reader communication has been established using SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC Specifications.

Command format (*abData* field in the *PC_to_RDR_XfrBlock*)

	Pseudo-APDU											
CLA	INS	P1	P2	Lc	Card Type							
FFh	A4h	00h	00h	01h	05h							

Response data format (*abData* field in the *RDR_to_PC_DataBlock*)

Where:

SW1 SW2 = 90 00h if no error.

8.3.2. READ_MEMORY_CARD

Command format (*abData* field in the *PC_to_RDR_XfrBlock*)

Pseudo-APDU											
CLA	INS	Byte /									
GLA	INS	MSB	LSB	MEM_L							
FFh	B0h										

Where:

MSB Byte Address	= 0000 00A $_9A_8b$ is the memory address location of the memory card.
LSB Byte Address	= $A_7A_6A_5A_4A_3A_2A_1A_0b$ is the memory address location of the memory card.
MEM_L	Length of data to be read from the memory card.

Response data format (abData field in the RDR_to_PC_DataBlock)

BYTE 1	 BYTE N	SW1	SW2

Where:

BYTE x Data read from memory card.

SW1 SW2 = 90 00h if no error.

Page 28 of 40

8.3.3. READ_PRESENTATION_ERROR_COUNTER_MEMORY_CARD (Only SLE4428 and SLE5528)

This command is used to read the presentation error counter for the secret code.

Command format (abData field in the PC_to_RDR_XfrBlock)

	Ps	eudo-A	PDU	
CLA	INS	P1	MEM_L	
FFh	B1h	00h	00h	03h

Response data format (abData field in the RDR_to_PC_DataBlock)

ERRCNT	DUMMY 1	DUMMY 2	SW1	SW2

Where:

ERRCNT The value of the presentation error counter. FFh indicates the last verification is correct. 00h indicates the password is locked (exceeded maximum number of retries). Other values indicate the last verification failed.

DUMMY Two bytes dummy data read from the card.

SW1 SW2 = 90 00h if no error.

8.3.4. READ_PROTECTION_BIT

Command format (*abData* field in the *PC_to_RDR_XfrBlock*)

Pseudo-APDU										
CLA	INIC	Byte /								
GLA	INS	MSB	LSB	MEM_L						
FFh	B2h									

Where:

MSB Byte Address	= 0000 00A ₉ A ₈ b is the memory address location of the memory card.
LSB Byte Address	= $A_7 A_6 A_5 A_4 A_3 A_2 A_1 A_0 b$ is the memory address location of the memory card
MEM_L	Length of data to be read from the memory card (in multiple of 8 bits; maximum of 32).
	$MEM_L = 1 + INT [(number of bits - 1)/8]$
	For example: To read eight protection bits starting from memory 0010h, the following pseudo-APDU should be issued as:
	FF B1 00 10 01h

Page 29 of 40

Response data format (abData field in the RDR_to_PC_DataBlock)

PROT 1	 PROT L	SW1	SW2

Where:

PROT y Bytes containing the protection bits.

SW1 SW2 = 90 00h if no error.

The arrangement of the protection bits in the PROT bytes is as follows:

PROT 1					PROT 2																		
P8	P7	P6	P5	P4	P3	P2	P1	P16	P15	P14	P13	P12	P11	P10	P9	:			:			P18	P17

Where:

Px is the protection bit of BYTE x in the response data.

'0' byte is write protected.

'1' byte can be written.

8.3.5. WRITE_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU									
	A INS	Byte A	ddress		Dute 1			Bute N	
CLA		MSB	LSB	MEM_L	Byte 1			Byte N	
FFh	D0h								

Where:

MSB Byte Address	= 0000 00A $_9A_8b$ is the memory address location of the memory card.
LSB Byte Address	= $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory card.
MEM_L	Length of data to be written to the memory card.
Byte x	Data to be written to the memory card.

Response Data Format (abData field in the RDR_to_PC_DataBlock)

Where:

SW1 SW2 = 90 00h if no error.

Page 30 of 40

8.3.6. WRITE_PROTECTION_MEMORY_CARD

Each byte specified in the command is used in the card to compare the byte stored in a specified address location. If the data match, the corresponding protection bit is irreversibly programmed to '0'.

Pseudo-APDU											
CLA	INS	Byte Address		MEM_L	Puto 1			Puto N			
CLA	MSB LSB	Byte 1			Byte N						
FFh	D1h										
Where:	Where:										
MSB	Byte Add	lress =	0000 00A ₉ A	8b is the me	emory add	ress loca	tion of th	ne memory card.			
LSB	Byte Add		$A_7A_6A_5A_4A_3$ ard.	$_{3}A_{2}A_{1}A_{0}b$ is	the memo	ory addres	ss locatio	on of the memory			
MEN	I_L	L	ength of data	a to be writt	en to the r	nemory c	ard.				
Byte	X	A	Byte values to be compared with the data in the card starting at <i>Byte Address</i> . BYTE 1 is compared with the data at Byte Address; BYTE N is compared with the data at (Byte Address + N - 1).								

Command Format (abData field in the PC_to_RDR_XfrBlock)

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error.

8.3.7. PRESENT_CODE_MEMORY_CARD (Only SLE4428 and SLE5528)

This command is used to submit the secret code to the memory card to enable the write operation with the SLE4428 and SLE5528 card, the following actions are executed:

- 1. Search a '1' bit in the presentation error counter and write the bit to '0'.
- 2. Present the specified code to the card.
- 3. Try to erase the presentation error counter.

Command Format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU										
CLA		P1	CODE								
GLA	INS	FI	P2	MEM_L	Byte 1	Byte 2					
FFh	20h	00h	00h	02h							

Where:

CODE Two bytes secret code (PIN).

Page 31 of 40

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2 ErrorCnt	
90h		
Where:		-
SW	1	= 90h

SW2 (ErrorCnt) = Error Counter. FFh indicates successful verification. 00h indicates that the password is locked (or exceeded the maximum number of retries). Other values indicate that current verification has failed.

Page 32 of 40

8.4. Memory Card – SLE4432/SLE4442/SLE5532/SLE5542

8.4.1. SELECT_CARD_TYPE

This command is used to power down and up the selected card in the card reader and performs a card reset.

Note: This command can be used only after the logical smart card reader communication has been established using SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC specifications.

Command Format (*abData* field in the *PC_to_RDR_XfrBlock*)

Pseudo-APDU									
CLA INS P1 P2 Lc Card Type									
FFh	A4h	00h	00h	01h	06h				

Response Data Format (*abData* field in the *RDR_to_PC_DataBlock*)

Where:

SW1 SW2 = 90 00h if no error.

8.4.2. READ_MEMORY_CARD

Command Format (*abData* field in the *PC_to_RDR_XfrBlock*)

	Pseudo-APDU										
CLA	INS	P1	Byte Address	MEM_L							
FFh	B0h	00h									

Where:

Byte Address = $A_7A_6A_5A_4 A_3A_2A_1A_0b$ is the memory address location of the memory card.

MEM_L Length of data to be read from the memory card.

Response Data Format (abData field in the RDR_to_PC_DataBlock)

BYTE 1	 BYTE N	PROT 1	PROT 2	PROT 3	PROT 4	SW1	SW2

Where:

BYTE x	Data read from memory card.
PROT y	Bytes containing the protection bits from protection memory.
SW1 SW2	= 90 00h if no error.

Page 33 of 40

The arrangement of the protection bits in the PROT bytes is as follows:

			PRC	DT 1				PROT 2															
P8	P7	P6	P5	P4	P3	P2	P1	P16	P15	P14	P13	P12	P11	P10	P9					:		P18	P17

Where:

Px is the protection bit of BYTE x in the response data.

'0' byte is write protected.

'1' byte can be written.

8.4.3. READ_PRESENTATION_ERROR_COUNTER_MEMORY_CARD (Only SLE4442 and SLE5542)

This command is used to read the presentation error counter for the secret code.

Command Format (*abData* field in the *PC_to_RDR_XfrBlock*)

Pseudo-APDU									
CLA INS P1 P2 MEM_L									
FFh	B1h	00h	00h	04h					

Response Data Format (abData field in the RDR_to_PC_DataBlock)

ERRCNT	DUMMY 1	DUMMY 2	DUMMY 3	SW1	SW2

Where:

- **ERRCNT** The value of the presentation error counter. 07h indicates that the last verification is correct. 00h indicates that the password is locked (exceeded the maximum number of retries). Other values indicate that the last verification has failed.
- **DUMMY** Three bytes dummy data read from the card.
- **SW1 SW2** = 90 00h if no error.

8.4.4. READ_PROTECTION_BITS

This command is used to read the protection bits for the first 32 bytes.

Command Format (*abData* field in the *PC_to_RDR_XfrBlock*)

Pseudo-APDU								
CLA	CLA INS		P2	MEM_L				
FFh	B2h	00h	00h	04h				

Response Data Format (abData field in the RDR_to_PC_DataBlock)

PROT 1	PROT 2	PROT 3	PROT 4	SW1	SW2

Where:

PROT y Bytes containing the protection bits from protection memory.

SW1 SW2 = 90 00h if no error.

The arrangement of the protection bits in the PROT bytes is as follows:

			PRC	DT 1							PROT 2												
P8	P7	P6	P5	P4	P3	P2	P1	P16	P15	P14	P13	P12	P11	P10	P9				:			P18	P17

Where:

Px is the protection bit of BYTE x in the response data.

'0' byte is write protected.

'1' byte can be written.

8.4.5. WRITE_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU								
CLA	INS	P1	Byte Address	MEM_L	Byte 1			Byte N	
FFh	D0h	00h							

Where:

Byte Address	= $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory card.				
MEM_L	Length of data to be written to the memory card.				
Byte x	Data to be written to the memory card.				

Response Data Format (abData field in the RDR_to_PC_DataBlock)

Where:

SW1 SW2 = 90 00h if no error.

8.4.6. WRITE_PROTECTION_MEMORY_CARD

Each byte specified in the command is internally in the card compared with the byte stored at the specified address. If the data match, the corresponding protection bit is irreversibly programmed to '0'.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA	INS	P1	Byte Address	MEM_L	Byte 1			Byte N
FFh	D1h	00h						

Page 35 of 40

Where:

- Byte Address = $000A_4 A_3A_2A_1A_0b$ (00h to 1Fh) is the protection memory address location of the memory card.
- **MEM_L** Length of data to be written to the memory card.
- Byte x Byte values to be compared with the data in the card starting at Byte Address. BYTE 1 is compared with the data at Byte Address; BYTE N is compared with the data at (Byte Address + N 1).

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error.

8.4.7. PRESENT_CODE_MEMORY_CARD (Only SLE4442 and SLE5542)

This command is used to submit the secret code to the memory card to enable the write operation with the SLE4442 and SLE5542 card. The following actions are executed:

- 1. Search a '1' bit in the presentation error counter and write the bit to '0'.
- 2. Present the specified code to the card.
- 3. Try to erase the presentation error counter.

Command Format (*abData* field in the *PC_to_RDR_XfrBlock*)

	Pseudo-APDU									
	INIC	D4			CODE					
CLA	INS	P1	P2	MEM_L	Byte 1	Byte 2	Byte 3			
FFh	20h	00h	00h	03h						

Where:

CODE Three bytes secret code (PIN).

Response Data Format (*abData* field in the *RDR_to_PC_DataBlock*)

SW1	SW2 ErrorCnt	
90h		
Where:		
SW	1	= 90h
SW	2 (ErrorCnt)	= Error Counter. 07h indicates that the verification is correct. 00h indicates the password is locked (exceeded the maximum number of retries). Other values indicate that the current verification has failed.

Page 36 of 40

8.4.8. CHANGE_CODE_MEMORY_CARD (Only SLE4442 and SLE5542)

This command is used to write the specified data as the new secret code in the card. The current secret code must have been presented to the card with the *PRESENT_CODE* command prior to the execution of this command.

Command Format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU									
	INC	D 4	D2		CODE					
CLA	INS	PI	P2	2 MEM_L	Byte 1	Byte 2	Byte 3

Where:

SW1 SW2 = 90 00h if no error.

Page 37 of 40

9.0. Other Commands Access via PC_to_RDR_XfrBlock

9.1. GET_READER_INFORMATION

This command is used to return the firmware revision number of the ACR39 reader.

Note: This command can be used only after the logical smart card reader communication with T=0 protocol has been established using SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC specifications.

Command Format (*abData* field in the *PC_to_RDR_XfrBlock*)

Pseudo-APDU				
CLA	INS	P1	P2	Le
FFh	09h	00h	00h	11h

Response Data Format (abData field in the RDR_to_PC_DataBlock)

FIRMWARE										

Where:

FIRMWARE 11 bytes data for firmware version.

Page 38 of 40

10.0.Other Commands Access via PC-to_RDR_Escape

10.1. GET_READER_INFORMATION

This command is used to return the firmware revision number of the ACR39 reader.

Note: This command can be used only on ACM39U with firmware 003R and above. In addition, the ACS driver must be installed first before using this command. If using the Microsoft CCID driver, another application must be used to enable the CCID Escape function.

Get Reader Information Format (5 bytes)

Command	CLA	INS	P1	P2	Lc
Get Firmware Version	E0h	00h	00h	19h	00h

Get Reader Information Response Format (5 bytes + Firmware Message Length)

Response	CLA	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	Number of bytes to receive	Firmware Version

Example:

Response = E1 00 00 00 0C 41 43 52 33 39 55 2D 30 2E 30 33 52 Firmware Version (HEX) = 41 43 52 33 39 55 2D 30 2E 30 33 52 Firmware Version (ASCII) = "ACR39U-0.03R"

Page 39 of 40

Appendix A. Response Error Codes

The following table summarizes the possible error codes returned by the ACR39:

Error Code	Status
FFh	SLOTERROR_CMD_ABORTED
FEh	SLOTERROR_ICC_MUTE
FDh	SLOTERROR_XFR_PARITY_ERROR
FCh	SLOTERROR_XFR_OVERRUN
FBh	SLOTERROR_HW_ERROR
F8h	SLOTERROR_BAD_ATR_TS
F7h	SLOTERROR_BAD_ATR_TCK
F6h	SLOTERROR_ICC_PROTOCOL_NOT_SUPPORTED
F5h	SLOTERROR_ICC_CLASS_NOT_SUPPORTED
F4h	SLOTERROR_PROCEDURE_BYTE_CONFLICE
F3h	SLOTERROR_DEACTIVATED_PROTOCOL
F2h	SLOTERROR_BUSY_WITH_AUTO_SEQUENCE
E0h	SLOTERROR_CMD_SLOT_BUSY

Table 3: Response Error Codes
